

Methodological Sheet

CNB's price data – Price of tradable and non-tradable items

I. Definition and content

CNB calculates inflation development of other subgroups of consumer prices for analytical reasons. There are year-on-year changes in % in the data set.

II. Sources and methodology of ascertainment

CNB takes over the CZSO (Czech Statistical Office) data about a price development of individual items. The inflation development of subgroups is calculated of them.

III. Break-down

Foundation is a separation of the tradable and non-tradable items. The tradable items are articles which an external price competition is possible at (mainly goods). The competition isn't largely possible at the non-tradable items (mainly services).

The data set includes these time series (the first-round impacts of tax changes are not excluded):

Fuel prices - growth of petrol, diesel oil and LPG (tradable prices)

Other tradables excluding food and fuel prices

Prices of nontradables excluding regulated prices

Prices of non-food commodities excluding regulated prices

Prices of tradables - food

Prices of nontradables - regulated prices

IV. Method of calculation

Data about price development of individual items (representatives) are taken over from the CZSO. The individual price indices of the representatives are aggregated into total indices of groups of representatives. Detailed information is presented on the methodological sheet at the prices indices which are included in this data series database – ARAD (“General statistics (Czech Statistical Office)”, “Prices”).

V. Change in methodology

The inflation development calculation of the subgroups (see III.) is updated after updates of the consumer price basket.

VI. Reporting entities

CNB calculates the presented data series on the basis of the CZSO data.
